

CHESTERFIELD SPECIAL CYLINDERS

Chesterfield Special Cylinders Ltd are specialists in high pressure gas containment. The business has for long been export-led. In the period since relocating to Sheffield in Summer 2005, the order book has nearly trebled and the export proportion of turnover has more than doubled.

This has been achieved whilst meeting the challenges of investing in new plant and re-establishing production in the new 110,000 square foot facility in the Meadowhall area.

The company excels in the design and manufacture of seamless steel high pressure gas cylinders - from very small breathing cylinders for aircrew and aircraft activation systems, to jumbo gas storage cylinders for the world's navies, and for motion compensation vessels and accumulators on offshore oil rigs.

These safety-critical products are vital system components designed to perform

in adverse environments over a very long service life. Chesterfield has a worldwide reputation for the quality and integrity of its products.

Among the recent projects for which cylinders have been supplied are

- secure air supply cylinders for emergency escape vessels for Russia
- flying stage activation cylinders for Oslo Opera House
- wind tunnel air cylinders for the Indian Space Research Organisation
- offshore storage vessels for rigs being built in China, Korea and Singapore to the order of a Norwegian customer for positioning in global waters

Chesterfield continue to develop overseas markets, due in part to their close collaboration with systems designers in the development stages of a project.

Very much at home in the Steel City, the company can be truly regarded as ...

Cylinder Makers to the World
